

I can not find my landmarcks created on the old mobile applications

For Android

The landmarcks will automatically be imported to the new application as points of interest when the final version of the application is released, which will also allow you to create new ones. Thanks for your patience.

For iOS

When switching to the latest Beta version, which replace the SityTrail France application update via TestFlight, previously created landmarcks on SityTrail France are converted to points of interest on the new version as soon as you have logged in you account and you launch the applicaton with the reliable Internet connection (Wifi, 4G or 3G).

You can find these points of interest corresponding to your landmarcks in a **specific list named "Landmarcks" + the date of the import**.

It is currently **not yet possible to view them on the map in the mobile application** (this will be the subject of a very next update) **or to create new ones** (this will be possible with the publication of the final version of the application).

However, for constraints related to the validation of applications by Apple, the **landmarcks created with the older applications other than SityTrail France (SityTrail Belgium, SityTrail World, ...)** unfortunately can not be imported into the new version of the application, you will need to recreate them manually, please excuse us.
